

Contents

1	CLASSICAL MECHANICS	1
1.1	Newtonian physics	1
	1. Simple pendulum	1
	2. Free fall with drag	3
	3. Collisions - 2 balls and a brick wall	5
	4. Collisions - two blocks and a spring	8
	5. Two unequal masses attached to a spring	9
	6. Hole dug through a diameter of the earth	10
	7. Hole dug through a chord of the earth	12
	8. Sphere with a spherical (off center) hole	13
	9. Moving inclined plane	15
	10. Particle moving in a cosine potential	17
	11. Particle moving in inverted Gaussian potential	19
	12. Hard sphere scattering - classical	20
1.2	Lagrangian and Hamiltonian Dynamics	23
	1. Brachistochrone	25
	2. Lagrange/Newton equivalence	28
	3. SHO - Lagrangian and Hamiltonian	29
	4. Simple pendulum - Lagrangian	30
	5. Simple pendulum with vertically moving pivot point	32
	6. Sliding pendulum	34
	7. Atwood's machine I	37
	8. Mass on table, pulley, hanging mass - Lagrangian	38
	9. Mass on table, pulley, hanging mass - Hamiltonian	40
	10. Projectile motion	41
	11. Hanging disk - Hamiltonian	44
	12. Hanging disk - Lagrangian	46
	13. Rod pivoted at the end	47
	14. Moving inclined plane	49
	15. Rotating massless rod - Lagrangian	51
	16. Rotating massless rod - Hamiltonian	53
	17. Atwood's machine II	55
	18. Sphere rolling on inclined plane	56
	19. Bead on a wire	58
	20. Two unequal masses attached to a spring	61
1.3	Central forces and orbits	63
	1. Conservation of angular momentum I	63

2. Conservation of angular momentum II	64
3. Kepler's laws	65
4. Newton's gravitational law deduced from Kepler's laws	66
5. Total energy for a central potential	68
6. Equation of the orbit	68
7. Total energy for a circular orbit	70
8. Spiral orbit I	71
9. Spiral orbit II	73
10. Inverse cube force law	75
11. Isotropic oscillator I	76
12. Isotropic oscillator II	77
13. Kepler effective potential	79
14. Kepler orbits	80
15. Runge-Lenz vector I	84
16. Runge-Lenz vector II	87
1.4 Normal modes and coordinates	89
1. Two pendulums coupled by a spring	90
2. Three springs, two masses	96
3. Double pendulum	98
4. Pendulum with oscillating pivot	102
5. Two springs with thin rod attached	106
6. Three particles, two springs (CO ₂)	108
References	111
2 QUANTUM MECHANICS	113
2.1 Introductory concepts	113
1. Bohr atom	113
2. Gravitational bohr radius	116
3. deBroglie wavelength of an electron in Bohr orbit	117
4. Uncertainty principle and the H-atom	118
5. Classical radius of the electron	119
6. Magnetic dipole moment of spinning charged sphere	120
7. Uncertainty principle and the SHO	121
8. Measurement, expectation values and probabilities	122
9. Expectation values: SHO	124
10. Expectation values: L-box	126
11. Rectangular barrier	128
12. Transmission and reflection over a square well	133
13. Delta function barrier I	134
14. Delta function barrier II	136
15. Semi-infinite barrier	137
2.2 Bound states in one dimension	140
Degeneracy	140
Parity	141
Characteristics of the eigenfunctions	141

	Superposition principle	142
	1. Stationary states	143
	2. Characteristics of eigenfunctions	144
	3. Delta function potential	147
	4. Half-well potential	149
	5. Sudden approximation I	150
	6. Sudden approximation II	154
	7. Wave function, probabilities I	155
	8. Wave function, probabilities II	157
	9. Sudden approximation III	160
2.3	Ladder operators for the harmonic oscillator	162
	1. Commutation of x and p	163
	2. General relations	164
	3. Expectation values I	168
	4. Expectation values II	170
	5. Expectation values III	171
	6. Matrix elements	174
	7. Expectation values IV	175
	8. Expectation values V	176
2.4	Angular momentum	177
	1. Operators and ladder operators	180
	2. Angular momentum eigenvalues	183
	3. Measurements and expectation values	185
	4. Speed of a "spinning hard sphere" electron	187
	5. Spinors	188
	6. Using Pauli matrices	188
	7. Spin ladder operators	190
	8. Electron in a B field	191
	9. Commutators	192
	10. Construct a Clebsch-Gordan table	193
	11. More Clebsch-Gordan	195
	12. Hyperfine structure of H-atom I	197
	13. Hyperfine structure of H-atom II	198
	14. Hard sphere scattering - quantum	201
2.5	Indistinguishable particles	204
	1. Bosons, fermions and the exchange force	204
	2. Two fermions in an SHO	206
2.6	Bound states in three dimensions	208
	1. 3D L-box	209
	2. Density of states for a 3D L-box	210
	3. Rigid rotor	211
	4. Infinitely deep spherical well	212
	5. Spherical shell well	213
	6. Classically forbidden region: H-atom	214
	7. Expectation value for H-atom	215

8. Kramer's relation	216
9. Bound state for unknown potential	218
10. Relation between H-atom quantum numbers	220
11. H-atom degeneracy	222
12. The quantum defect	223
2.7 Approximation methods	227
The WKB approximation	227
1. Energies of an L-box	228
2. Energies of an SHO	229
3. Transmission through a parabolic barrier	230
The variational method	231
1. Estimate the ground state energy of an SHO	233
2. Estimate the first excited state energy of an SHO	234
3. Linear potential well	237
4. Quartic potential well	239
Non-degenerate perturbation theory	242
1. Gravitational correction to H-atom energy	243
2. L-box perturbed by a delta-function	244
3. L-box perturbed by a linear function	245
4. Relativistic correction to L-box	247
5. Charged SHO perturbed by constant electric field	250
6. H-atom perturbed by delta function	253
7. Relativistic correction to SHO	254
8. Relativistic correction to H-atom	256
9. Quartic perturbation of SHO	258
10. Matrix eigenvalues	259
The helium atom	263
1. He-atom ground state energy	263
2. He-atom: perturbation/variation	265
Degenerate perturbation theory	266
1. 2-D a-box with xy perturbation	267
2. Particle on a ring with delta-function perturbation	270
3. 2-D SHO with xy perturbation	273
4. Select set for 3x3 matrix	276
Time dependent perturbation theory	278
1. Gaussian perturbation applied to particle in an L-box	279
2. E-field pulse applied to particle in an L-box	281
3. Exponential perturbation applied to SHO	284
4. Pulse applied to SHO	286
5. Exponential E-field applied to H-atom	288
6. Fermi's Golden Rule	290
