CHAPTER 1 - BACKGROUND	1
1.1 Introduction	1
1.2 The Bohr model of the atom	2
1.3 Numerical values and the fine structure constant	9
1.4 Atomic dimensions – is a_0 a reasonable atomic diameter?	11
1.5 Localizing the electron: Is a point particle reasonable?	13
1.6 The classical radius of the electron	14
1.7 Atomic units	15
CHAPTER 2 - ANGULAR MOMENTUM	18
2.1 Introduction	18
2.2 Commutators	23
2.3 Angular momentum raising and lowering operators	26
2.4 Angular momentum commutation relations with vector operators	33
2.5 Matrix elements of Vector operators	35
2.6 Eigenfunctions of orbital angular momentum operators	40
2.7 Spin	46
CHAPTER 3 - ANGULAR MOMENTUM - TWO SOURCES	62
3.1 Introduction	62
3.2 Two sets of quantum numbers - uncoupled and coupled	63
3.3 Vector model of angular momentum	69
3.4 Examples of calculation of the Clebsch-Gordan coefficients	73
3.5 Hyperfine splitting in the hydrogen atom	81
CHAPTER 4 - THE QUANTUM MECHANICAL HYDROGEN	95
4.1 The radial equation for a central potential	95
4.2 Solution of the radial equation in spherical coordinates - the energy eigenvalues	98
4.3 The accidental degeneracy of the hydrogen atom	101
4.4 Solution of the hydrogen atom radial equation in spherical coordinates - the energy eigenfunctions	103
4.5 The nature of the spherical eigenfunctions	107
4.6 Separation of the Schrödinger equation in parabolic coordinates	109
4.7 Solution of the separated equations in parabolic coordinates - the energy eigenvalues	112
4.8 Solution of the separated equations in parabolic coordinates - the energy eigenfunctions	115
CHAPTER 5 - THE CLASSICAL HYDROGEN ATOM	120
5.1 Introduction	120
5.2 The classical degeneracy	125
5.3 Another constant of the motion - the Lenz vector	127
CHAPTER 6 - THE LENZ VECTOR AND THE ACCIDENTAL DEGENERACY	136
6.1 The Lenz vector in quantum mechanics	136
6.2 Lenz vector ladder operators; conversion of a spherical eigenfunction into another spherical eigenfunction	142
6.3 Application of Lenz vector ladder operators to a general spherical eigenfunction	148
6.4 A new set of angular momentum operators	152
6.5 Energy eigenvalues	154
6.6 Relations between the parabolic quantum numbers	157
6.7 Relationship between the spherical and parabolic eigenfunctions	160

CHAPTER 7 - BREAKING THE ACCIDENTAL DEGENERACY	164
7.1 Introduction	164
7.2 Relativistic correction for the electronic kinetic energy	166
7.3 Spin-Orbit Correction	168
7.4 The Darwin Term	170
7.5 Evaluation of the terms that contribute to the fine-structure of hydrogen	171
7.6 The total fine structure correction	178
7.7 The Lamb shift	180
7.8 Hyperfine structure	183
7.9 The solution of the Dirac equation	187
CHAPTER 8 - THE HYDROGEN ATOM IN EXTERNAL FIELDS	190
8.1 Introduction	190
8.2 The Zeeman effect – the hydrogen atom in a constant magnetic field	191
8.3 Weak electric field - the quantum mechanical Stark effect	208
8.4 Weak electric field - the classical Stark effect	223
CHAPTER 9 - THE HELIUM ATOM	230
9.1 Indistinguishable particles	230
9.2 The total energy of the helium atom	233
9.3 Evaluation of the ground state energy of the helium atom using perturbation theory	237
9.4 The variational method	240
9.5 Application of the variational principle to the ground state of helium	242
9.6 Excited states of helium	245
9.7 Doubly excited states of helium: autoionization	251
CHAPTER 10 - MULTIELECTRON ATOMS	254
10.1 Introduction	254
10.2 Electron Configuration	255
10.3 The designation of states - <i>LS</i> coupling	257
10.4 The designation of states – <i>jj</i> coupling	268
CHAPTER 11 - THE QUANTUM DEFECT	276
11.1 Introduction	276
11.2 Evaluation of the quantum defect	280
11.3 Classical formulation of the quantum defect and the correspondence principle	286
11.4 The connection between the quantum defect and the radial wave function	293
CHAPTER 12 - MULTIELECTRON ATOMS IN EXTERNAL FIELDS	297
12.1 The Stark effect	297
12.2 The Zeeman effect	307
CHAPTER 13 - INTERACTION OF ATOMS WITH RADIATION	316
13.1 Introduction	316
13.2 Time dependence of the wave function	318
13.3 Interaction of an atom with a sinusoidal electromagnetic field	320
13.4 A two state system – the rotating wave approximation	323
13.5 Stimulated absorption and stimulated emission	327
13.6 Spontaneous emission	335
13.7 Angular momentum selection rules	342
13.8 Selection rules for hydrogen atoms	344
13.9 Transitions in multi-electron atoms	349
