**LOCATION SPECIAL, PART 3: ASSESSING COUNTRIES**

Once a decision has been made to offshore work, how do executives assess the relative merits of each location? Professors Leslie Willcocks and Mary Lacity and LSE research fellow Andrew Craig present our most in-depth location report to date.

The political ramifications of offshoring for domestic employment have already been explored in this issue.

But if and when an organisation has decided to offshore work, how does it go about choosing the right location? This article presents some answers, and focuses, but not exclusively, on a popular area of business process outsourcing (BPO): voice and contact centre work.

Recent research by the London School of Economics (LSE) has led to the development of a framework for assessing countries’ attractiveness as BPO locations. The 20 factors that emerged from this research are arranged under six main headings below*, and the corresponding factors are listed within of those sections.

The authors interviewed 30 global sourcing analysts in client, provider, consultancy, market analysis, and research organisations. Those analysts identified 10 countries that are competing directly for similar UK work – India; the Philippines; South Africa; Poland; Morocco; Malaysia; Kenya; Sri Lanka; Egypt; and Northern Ireland (part of the UK, and therefore not strictly offshore). Using the LSE framework, the authors sought expert commentary on these countries’ merits as business locations, folding in their own research.

1. Cost
   (Labour; Infrastructure; Taxes and incentives)

Cost is invariably in the top three reasons for outsourcing or setting up captives (wholly owned centres) overseas. However, it is not a simple equation to arrive at.

One commonly used measure is direct operating cost per full-time employee. India, the Philippines, Malaysia, and Egypt have the most attractive operating costs when calculated in this way, while Poland, Northern Ireland and South Africa are most expensive across the selected skills base.

However, all 10 locations are subsidised to some degree through tax allowances and →

---

*Authors’ note: Dana Farrell’s six-factor methodology (see standalone RightSourcing supplement: Professional Outsourcing Autumn 2002) uses the same main headings, but the 20 factors identified by the LSE come from reading across all the academic studies and from the authors’ interviews with 30 sourcing analysts. The authors acknowledge Farrell’s work and her paper, published in the Harvard Business Review.
Egypt, June 2013: Anti-government protesters show the ‘Arab Spring’ is ongoing.
government/regional incentives for inward investment. Post-subsidy, the net effect moves South Africa higher up the league table, behind Malaysia, India and the Philippines.

Another factor is the infrastructure cost, specifically telecommunications/internet and power. The Philippines benefited from early deregulation that pushed down bandwidth costs by 40 per cent (demonstrating how quickly the offshore cost equation can be changed by governments’ actions).

South Africa plans to reduce its telecoms costs by 20 per cent over the next three years, but at the other end of the continent, Egypt’s power, telecoms and internet access costs are already among the lowest. Northern Ireland’s costs are very competitive in a Western European context.

**Market dynamics**

Other factors are relevant in calculating overall cost. The first is the client’s location. For captive offshoring, client companies compare destinations with their own domestic costs. By this comparison, all locations (including Northern Ireland within the UK) offer savings of between 25 and 75 per cent.

But market dynamics are changing. India and the Philippines are experiencing an erosion of their cost advantage due to scale and accelerating demand, creating skills shortages that drive up labour prices. One result is that these countries are themselves outsourcing and offshoring work to Egypt, Sri Lanka, and China in order to stabilise their labour costs locally.

A final factor is hidden costs. Providers in many of the countries suffer from a widespread shortage of middle management and team-leadership skills (notable exceptions being Poland and Northern Ireland). Dealing with such shortages costs time, money, and sometimes productivity. Clients often fail to consider their own internal management costs as well.

- In terms of cost overall, India remains the most attractive country for the time being. The costs considered were a combination of startup, infrastructure and labour costs. Kenya is second on costs, followed by the Philippines, South Africa, and Egypt.

**2. Skills**

(Skills pool; Provider landscape)

The true availability of skills in another country can be tough to assess. Poland and Northern Ireland have well-developed education systems that are generally strong in sciences, technology, engineering and business, and these are accessible to the majority of their populations.

This contrasts with less access to education and with lower levels of English/other language proficiency in several African and Asian countries. However, the labour pools of Poland and Northern Ireland remain limited and could come under pressure in the face of growing demand.

The scalability of labour resources in the longer term is a major issue for client companies to consider. The number of graduates produced annually by any country is one indicator of how scalable the labour pool for the country will be in the long run.

In 2012, India added 230,000 employees to its 2.8 million ITO/BPO workforce. India, of course, remains the offshore powerhouse and its universities produced 4.4 million graduates in 2012, with almost 16 per cent of them focused on science and technology. However, reports suggest that only around 30 per cent of these graduates are readily employable.

Pressure on skills and wages is pushing Indian providers and captives towards Tier-2 cities, and towards other cheaper locations both within India and overseas (such as the Philippines). India has an 800,000 call centre workforce, but has seen repatriation to the UK and US over service quality issues and Indian centres’ unpopularity with end-users.

Egypt produces over 330,000 graduates annually, nearly 10 per cent of whom
have degrees in technology, science, or engineering. Over 25,000 graduates annually from Cairo alone are able to speak English and other European languages. Like several countries, however, Egypt has struggled to build the requisite middle management skills in BPO. However, its location is to its advantage, making it a nearshore prospect for clients in the UK and Europe.

In South Africa, graduates and postgraduates have exceeded 140,000 annually in recent years, with 51 per cent in science, engineering, technology and business. South Africa added 370,000 people proficient in English to the workforce in 2011 (compared with 4.4 million in India, and 450,000 in the Philippines). Malaysia added 160,000 and Egypt 70,000. South Africa is also strong in legal, accounting and business skills.

(Above): The catastrophic collapse of a garment factory near Dhaka in April 2013 led to the loss of 1129 lives. It also brought Western outsourcing practices into focus, as most of the clothes made in the region are destined for low-cost outlets in the UK and US. In May, a garment factory collapsed in Cambodia, killing two. See box, page 27, for more on these issues. (Photo: Press Association).

“Like several countries, Egypt has struggled to build the requisite middle management skills in BPO. But its location is to its advantage.”

In the Philippines, 82 per cent of outsourced work is voice contact, primarily to the USA. The rest is in ITO/BPO services, including finance, accounting, medical transcription, HR and IT. Filipino residents are considered to speak a more ‘American-style’ version of English than their Indian counterparts. As a result, the Philippines overtook India as the world’s offshore call centre capital in 2011.

By 2012, the Filipino BPO industry employed over 640,000 people. This is expected to rise to 1.3 million, provided the country’s key skills-creation problems can be addressed. Like India, the Philippines faces challenges in skills shortages, retention of talent, and rising labour costs. Some government action has been taken to address the skills issue. Sri Lanka has an adult literacy rate →
neighbour, India. Sri Lanka has strong IT skills, with over 120 software development firms and estimated IT exports exceeding $70 million (£45 million). However, its ITO/BPO export revenues are set to grow to $1 billion (£640 million) by 2015. Sri Lankan software is used globally by several airlines and also operates a number of stock markets throughout the world. Several international technology companies have set up operations in the country, focused on research and development.

Kenya is at a relatively early stage in development as an offshore location, but has satisfactory skills in IT, English, and, to some extent, knowledge processes – enough to support further foreign investment in its growing ITO/BPO industry.

Morocco is well positioned to provide nearshore support to European-based companies. Morocco offers well-trained people, and for voice BPO has strong capabilities in French and Spanish, as well as in English. In particular, it has a large pool of skilled people in the region where banks, computing, and insurance companies are becoming clients.

Morocco’s business parks already host more than 100 multinationals, and it intends to grow an outsourcing workforce of more than 90,000 people by 2017, concentrating on shared service centres, non-voice BPO, voice BPO, and ITO.

Skills challenges
Malaysia has a literacy rate of 92 per cent and a workforce of over 12 million, with over 180,000 graduates entering the labour market annually, 54 per cent of whom have science and technology degrees. English speakers make up 28 per cent of the population. The country’s education and training programmes support IT, finance and accounting, and general BPO activities.

- Widespread shortages of middle management and team leadership skills typify mature locations such as the Philippines, India, and Sri Lanka, as well
as emerging locations such as Kenya and Egypt. Northern Ireland and Poland, however, have strong capabilities, which gives them an advantage.

(Separate LSE research shows that good middle managers are essential for outsourcing relationships to succeed.)

- India and the Philippines have the highest levels of skills availability in general, but this can vary by region and, in common with all locations, also by city. However, while India has the biggest skills base, it also has the greatest demand. Sri Lanka and South Africa are more likely to focus on specific target markets in which they have both resources, and on cultural/institutional affinity.

3. Environment

(Government; Business; Quality of life; Accessibility)

All governments try to attract foreign investment (FDI), and many offer special development zones — such as the free trade zone in Egypt and the nearshore centres in Morocco. Most of these offer tax breaks, simplified administration procedures, reduced bureaucracy, and, in some case, more flexible labour rules.

In India, the business environment varies by region, and the legal system is not always as supportive as it is in South Africa, Malaysia, Poland, or Northern Ireland. (As Professional Outsourcing went to press on 15 June, a £100 million Northern Ireland economic plan was agreed, designed to help revive the region’s prospects.)

Intermediary agencies help, with the exemplars being Nasscom in India and the Business Processing Association in the Philippines. Similar organisations operate in nearly all the countries studied, but with a lower profile and less engagement.

Most governments understand that, to support an emerging or mature BPO industry, strong action is required to eradicate corruption. Transparency International’s Corruption Perceptions Index reports on this issue, showing a changing picture from year to year.

- Your moral compass: human rights

Methodologies for choosing offshore locations should also include the impact on the host nation and its workers. Issues include local labour laws, practices and safety, but also human rights records — including censorship, and discrimination on the grounds of ethnicity, gender, faith, politics, disability, and sexuality.

All of the countries discussed have set out to attract FDI and trade. But the distortions that outsourcing can create in local economies, and any failures in how those countries treat their own workers, are both issues that can be amplified by Western money.

For example, the BBC reports that two months after the Rana Plaza factory collapse in Bangladesh (pictured above) that killed more than 1,100 people, new building inspections reveal that six out of every 10 factories in that country are unsafe — but still full of workers. Most of the garments produced in Bangladesh are destined for Europe and the US, often for fast-fashion outlets.

In some nations, human rights and equality issues are a particular consideration, including countries that allow child labour or which lack equal opportunities for women. There are also those that use the death penalty to suppress political dissent, or advocate its use against minors and against minorities, such as gay men.

Failure to consider these issues could be interpreted as tacit support. That said, many developing nations regard any perceived interference in such areas as a form of imperialism.

LSE Outsourcing Unit research shows that over half of client organisations now include a corporate social responsibility (CSR) assessment of vendor countries when making outsourcing decisions. But that means that nearly half of all enterprises are failing to do so.

A range of organisations can help, including: Amnesty International (www.amnesty.org.uk); The Index on Censorship (www.indexoncensorship.org); the Trades Union Congress (www.tuc.org.uk); and the International Labour Organisation (www.ilo.org), which is part of the UN.
Generally, Northern Ireland, Malaysia, Poland, and South Africa tend to score better against corruption; India and Morocco less so; and the Philippines, Egypt, Sri Lanka, and Kenya less so again. However, business environments can be made more compatible with clients’ standards through the setting up of controlled business zones – such as India’s and Morocco’s business parks.

As business environments, Malaysia, South Africa, Northern Ireland, and Poland tend to be more compatible with their target markets, while Kenya has had to make concerted efforts to stabilise the business zone around Nairobi. Sri Lanka and India have strong cultural compatibilities with the UK market – although that has not prevented Indian call centres’ from being unpopular with end-users.

In terms of the living environment overall, South Africa, Northern Ireland, and Malaysia – followed by India and the Philippines – score highest, and Kenya the lowest.

The question of time
From a UK perspective, Northern Ireland (as part of the UK), Poland, Egypt, Morocco, and South Africa all have compatible timezones, but countries like Morocco and Egypt can play into nearshore niches that give them advantages. That said, clients may take advantage of the timezone differences between them and India, Sri Lanka and Malaysia, for example, to create 24x7 services for themselves and their customers. The Philippines, meanwhile, scores more highly on accessibility with its US-based customers.

• On the ‘Government’, ‘Business’, and ‘Quality of life’ factors, respondents were consistent in their scoring, but on accessibility they recognised that much depended on what the target markets were for each country. Combining all of these factors, Northern Ireland scored highest, followed by Poland and South Africa. Malaysia, India, and the Philippines ranked equal fourth, according to our analysts.

4/ Quality of infrastructure
(ICT: Real estate, Transport, Power)
It is difficult to run an offshore voice/contact centre operation without reliable, fast technology that has low downtime, swift restoration of service, and good connectivity. Most Tier-1 and Tier-2 Indian locations achieve this.

Malaysia has advanced IT and telecoms facilities. In other Asian and North African countries, it is common to find an advanced IT infrastructure in business parks and large cities, but limited infrastructure in rural areas – if any at all. Thus Morocco has a good infrastructure, but mainly in its special development zones. The Philippines stands out as having particularly good telecoms, with a reliable domestic and inter-island service because of the US military bases there.

South Africa has made rapid strides in both stabilising and developing its ICT infrastructures.

Polish ICT is comparable with UK (including Northern Ireland) and French infrastructures. At 61 per cent, Northern Ireland’s internet penetration is lower than the UK average of 65 per cent, but superfast broadband coverage is on 94 per cent of connections compared with 60 per cent for the UK as a whole, according to Ofcom figures. Sri Lanka has a relatively good record, while Kenya is building its capability and already has better access to steady connectivity.

Property questions
The cost of real estate can be an unpleasant surprise in some offshore locations. Mumbai and Bangalore in India, for example, are no longer inexpensive. As a country or city grows its offshoring market, property prices rise – as is happening in Poland, for example. The Philippines still enjoys low real estate costs, and hosts special economic zones in several cities. Parts of South Africa offer less expensive land than the Philippines.

Property and land costs vary across the other locations, with Malaysia and Northern Ireland joining Poland at the
higher end. Sri Lanka and Kenya are at the lowest end, while Egyptian and
Moroccan costs tend to be ringfenced
within the business parks.

Transportation and power tend to
be at their most efficient and reliable in
Poland, South Africa, Northern Ireland,
and Malaysia. The Indian experience is
highly dependent on location. Roads
and transportation are generally of low
quality in the Philippines – although,
as in India, the BPO sector often operates
in protected conditions created by the
service providers themselves.

Morocco tends to have better transport
and power facilities than Egypt, although
Egypt has been upgrading extensively
over the last three years. Of the 10
countries, Sri Lanka and Kenya are at
the bottom end on these factors.

Outside the top few countries, it is
common to find that transportation and
power infrastructures are more developed
around areas where a workforce with the
required skills is available, and often only
near international airports, major cities,
or development zones.

- Respondents rated Poland and
Northern Ireland as top on infrastructure
overall, followed by Malaysia, South
Africa, India, and the Philippines.
However, this may reflect particular
experiences of the BPO environment,
rather than a broader country context.
Kenya is rated lowest overall, followed
by Egypt and Sri Lanka.

5/ Risk
(Security; Disruptive events; Macroeconomics;
Regulations; IP)
When making offshoring decisions,
companies have typically been driven
by cost, skills, and service considerations.
But with political upheaval and economic
problems across many parts of the world,
risk has taken on greater significance.

“Transportation
and power tend to
be at their most efficient
and reliable in
Poland, South
Africa, Northern
Ireland, and
Malaysia.”

(Above) While some outsourcing
vendors’ profits are up, India’s
economy may be running out
of steam. At the same time,
Western economic uncertainty
remains. Indian growth was 4.8
per cent in Q1 this year, healthy
by Western standards but the
slowest rate for India in a decade.
(Photograph: Press Association)

One eye on the economy?: Wipro’s Azim Premji faces the prospect of stalling growth.
For example, Egypt’s BPO activity stalled when the Arab Spring swept across its region in 2011, while natural disasters have affected many parts of the world, especially in Asia.

Terrorism has had a high profile in many countries, including India, Sri Lanka, Egypt, Northern Ireland, and Kenya. Such risks can be on a national scale, or limited to disputed areas. More common risks to personal security come from fraud and crime, and this tends to vary by region and by city.

**The risk league**

Egypt, Kenya and Sri Lanka were rated by respondents as the highest-risk countries in political terms, but this may swiftly change. For example, respondents scored Malaysia, Northern Ireland and Poland as countries with the lowest political risk – but Malaysia suffered unrest in June 2013, while as **Professional Outsourcing** was going to press, anti-capitalist protests were being planned in Northern Ireland ahead of the G8 summit. Serious rioting has taken place in Turkey, and occurred in France and elsewhere in previous weeks.

Despite isolated attacks, Morocco has remained largely unaffected by the Arab Spring, while South Africa’s violent suppression of labour unrest in 2012 can – hopefully – be placed in the context of a relatively stable democracy and economy. India and the Philippines are also considered stable for business purposes.

**Professional Outsourcing** believes that risk calculations should also include other criteria, in line with organisations’ Corporate Social Responsibility (CSR) policies. These include local labour laws, working conditions, and human rights issues generally [see box, page 27].

Regulatory risk is another consideration. Northern Ireland, Poland, and Malaysia have the best profiles, while Kenya, Egypt, and Sri Lanka have the worst, said respondents. India receives some criticism about its legal inefficiency, while the Philippines, South Africa, and Morocco are rated as meeting business requirements.

**Intellectual property (IP) risk** is seen as being worst in Sri Lanka, Kenya, and Egypt, followed by Morocco. There is divided opinion about IP security in India and the Philippines, which may reflect their large market sizes (and, therefore, a broad range of client experiences). Northern Ireland and Poland are rated as offering excellent IP security, while South Africa and Malaysia are seen as good.

Respondents found macroeconomic risk difficult to anticipate, given the complexity of the world economy post-2008. But as far as it can be predicted, Sri Lanka and Egypt received the lowest rating, followed by Kenya. India, the Philippines, and Northern Ireland received the highest ratings. South Africa, Poland, Morocco and Malaysia were each seen as robust. However, respondents registered more reservations and differences of opinion on this than for any other factor in the survey.

• Combining the five risk factors, Northern Ireland and Poland emerge as having the best risk profiles of the 10 locations, followed by India, South Africa, and Malaysia. Kenya and Egypt are considered the most risk-prone countries in the sample, followed by Sri Lanka. However, all locations are seen as meeting minimum requirements.

**6/ Market potential**

((Local markets; Nearby markets))

In terms of scale and range of services, India with $68 billion (£43.7 billion) ITO/BPO annual revenues is easily number one in the captive and offshoring market, but is less strong on supply to the host and nearby region. The Philippines is next largest, with $11 billion (£7 billion) in revenues. According to respondents, both these countries will use this base to accelerate their growth over the next five years – despite hard evidence that the Indian economy is slowing down.

Indian providers are increasingly offering best-shoring models, mixing skills
onshore, offshore and ‘anyshore’ in the search for optimal prices and skills. Both India and the Philippines are attempting to move higher up the value chain into complex BPO.

Given these advantages, the other eight competing countries tend to seek service niches in order to differentiate, gain new business, and build momentum and scale. Sri Lanka gains ‘overload’ work from India at a lower price point, but is gaining momentum in software development, accounting, and legal processing services.

Morocco will continue to be a relatively small but growing market, mainly nearshoring services for Western Europe. Egypt has voice captives and a small but growing IT services and BPO market. However, its offshoring promise is temporarily on hold while political and economic instabilities remain.

**Competing attractions**

Malaysia is a second-tier outsourcing location with good cost competitiveness, English, and technical skills. It seeks to grow itself as an ITO/BPO location and has good infrastructure for captive operations, but is still looking for its precise focus and market(s).

Poland has been growing fast as a destination both for nearshore work from Western Europe, and for large global providers. Its education dividend in technical and engineering skills and highly employable workforce give it leverage in complex ITO/BPO work, as well as more commoditised services. In time, cost pressures will emerge as a ‘problem of success,’ as is already the case in India.

Northern Ireland also has a strongly employable ITO/BPO workforce but at a less attractive price point, and so is likely to gain momentum in less recessionary conditions to take advantage of its nearshore positioning in Europe (and its affiliations with the US).

Respondents see South Africa as a rising offshore location with strongly differentiated services, but which is underplaying its potential strengths in financial services and legal process outsourcing. Kenya is seen as a start-up location with limited scale, able to deliver on IT, voice, and some commodity back office work, but needing several years of sustained investment and marketing to achieve the scale of the other locations.

- Respondents were asked to rate the attractiveness of local markets, and the access to nearby markets. Here India and South Africa were perceived as having the top market potential, although both received lower scores for ‘access to nearby markets’ than for ‘access to local markets.’ Clearly, also, the scale of the opportunity in each case is different.
- The Philippines, Malaysia and Poland were the next placed, while Kenya and Egypt were ranked lowest. In Egypt’s case, this reflects a real downturn in fortunes from 2009, when it was ranked the top non-BRIC country on this factor. Its poor risk profile has downgraded its market potential considerably.

**Conclusion**

All 10 of these countries are valid offshore destinations. Considering the average country competitiveness scores across all six primary factors, India is ranked first, and the Philippines, Poland, and South Africa are tied for second.

However, the most important finding is that there is now little variation among the top six ranked countries. India, the Philippines, Poland, South Africa, Northern Ireland, and Malaysia are all rated as good offshore destinations overall. Morocco, Sri Lanka, Egypt, and Kenya all meet minimum requirements.

So where does all this leave the buyer? First, no client organisation should select offshore destinations by focusing solely on relative country advantages. Most buyers understand that cost drivers, environmental factors, and risk profiles can rapidly shift, but they should nevertheless take all of these factors seriously, along with the hidden costs and the domestic impact of their decisions.

Second, decision-makers should use the country advantages outlined in this report in conjunction with a broader set of business criteria. This means considering the organisation’s strategic objectives and its overall commitment to certain destinations – including, perhaps most importantly, within the home country.
